

Session History Summary (Reflect)

Reflect

Past 3 months

Based on your conversations in Claude chat.

Building EMS ReadyKit from code to crew.

Most of this quarter went into one thing: getting EMS ReadyKit from a working codebase to a system real EMTs can use. You moved through backend schema changes, Terraform infrastructure, Azure AD auth debugging, frontend UI fixes, and live deployment — often in the same session. You used Claude as a second set of eyes on root causes and as a drafting surface for migrations, test files, and Terraform modules, then made the calls yourself. The pace picked up in June, and the sessions got longer.

👤 DELEGATION

Drafts and investigations go to Claude; structural calls go to you.

You'd hand off the Terraform module rewrite, the test file scaffolding, or the seed-data merge table — then make the architectural call yourself, like choosing per-station item scoping over shared-catalog visibility, or picking lifecycle ignore_changes over fighting the azuread provider.

📄 DESCRIPTION

Every session opens with the same three files and a clear task.

You'd start with "Read CLAUDE.md and CODEBASE_INDEX.md" and name the backlog item or bug before anything else — and when quota felt tight, you said so directly ("pay close attention to the run rules, you are making a lot of mistakes").

Create a focused project

 DISCERNMENT

You catch when a fix is treating the symptom instead of the cause.

You asked "what shows the best software engineering practice" before accepting the ItemUpdate schema fix, pushed back on running seed.py unconditionally because it would overwrite admin changes, and spotted that the station count gate was the real problem after two rounds of extraction-logic fixes.

 DILIGENCE

The credential that got pasted into chat stayed on your list until it was rotated.

You flagged the exposed Postgres password as a follow-up, tracked it through SEC-AL1, and closed it with a Terraform taint-and-apply cycle that also caught the @ character in the generated password corrupting the connection URI.
